

Hybrid Concrete Tower Mould

The horizontal mould is easy to operate, with fewer opening and closing bolts, fast speed, efficient cleaning and turnover. To achieve both quality and efficiency, the FEM analysis of the steel structure and vibrators distribution ensures continuous production without deformation and high concrete compactness.

HICORP hybrid concrete tower moulds have led the market share for 3 consecutive years, and have successfully delivered large-scale projects for Mingyang and Sany Heavy Energy, etc. Among them, the 200MW project has promoted the green transformation of Northeast China, with an estimated annual power generation of 500 million kWh and significant emission reduction.
